In a small window that pops up on your screen (the one from Step 8), you will see an error which means that you do not have permission to run the script. If you have all of the required tools, you just need to choose the "Allow" option: You can now continue with the instructions from Step 8. A: I would install the Pycharm IDE. It has a great Python plugin that works really well with Pyo. A: If you know somewhere else that you could install a Python IDE then you could do that. Another option could be to run Pyo. After reading the Xforce documentation I don't think I have anything to add as it seems you are using the Pyo (Python XForce) GUI for the entire Pyo setup and installation. The good news is that you are using the same computer and the same programming language. It looks like you don't have to install and maintain two environments. However, it is a bit tricky to try and search for PyCharm in the app store. If you find it then you can install. If not you can follow these instructions: From the Home screen, tap on the My Apps button. Tap on the More tab. Tap on the Search box. Type in PyCharm. Tap on the Search button Download the app from the app store Relaunch the app I. Field of the Invention The present invention relates generally to a method for mounting a component such as a lamp assembly to a vehicle seat frame and, more particularly, to a method of mounting a lamp assembly to a recessed space or "well" formed within a vehicle seat frame. II. Description of Related Art It is well known to mount a lamp assembly within a vehicle seat frame. Typically, a portion of the seat frame includes a channel for receiving and supporting the lamp assembly, and a U-shaped clip is applied to the lamp assembly and inserted into the seat frame channel. While this arrangement is successful in mounting the lamp assembly to the seat frame, it is generally a time-consuming and labor-intensive process. Furthermore, the U-shaped clip itself must be applied to the lamp assembly, which may adversely affect the finish and appearance of the lamp assembly. This problem may be particularly severe if the vehicle seat includes a finely finished surface. A second mounting technique is to attach the lamp assembly directly to the vehicle frame member. One such arrangement

Thanks A: You can try this stripslashes(mysql_real_escape_string(\$output)) Q: How can I target a specific div of a certain class? I have a PHP block of code that prints out the necessary HTML for me as follows: "; \$output.= "" ; \$output.= "" ; echo \$output; } I can't figure out how to target a specific div of "slide", and print only the HTML for that div. Any suggestions? A: Let's say you want to do this: foreach(\$allresults as \$result) { \$output = "" . "" . "" ; echo \$output; } ...then all you'd need to do is to add this to the end of the loop: echo \$output; That will spit out a chunk of html with every iteration of the loop, the only difference being that each successive iteration will have the content that comes after the ... close wrapped in another ... For your specific case, I think you'd want to look at the find_all() method in DOMDocument, which will do what you want. Something like this: \$output = ""; foreach(\$allresults as \$result) { \$output = "" ; \$output.= "" ; \$output.= "" ; } \$doc = new DOMDocument(); \$doc->loadHTML(\$output); // Find all divs with a class of "slide" \$divs = \$doc->getElementsByTagName
