1. **Locate and download the Photoshop Elements 10.0 trial (www.adobe.com) on your computer.** The download is an.exe file. To get to the installation program, launch the browser and open the website. The step-by-step directions are provided, so read them thoroughly before downloading. Also, you should make sure that you are running Windows XP or Windows Vista. (The instructions are from a Windows XP computer.) You may need to configure the program for compatibility in your operating system.
2. **Double-click the downloaded file to start the installation program.** This generates an icon in the Windows Start menu.
3. **Run the Photoshop Elements installation program.** The installation process can take a few minutes. While it's running, go through the quick setup options available by clicking on the icon.
4. **Start the trial.** A copyright agreement (Universal Permissive License) and your personal copyright license are accepted by clicking on the next button. The license agreement is displayed in the middle of the screen and takes about four to five minutes to complete.
5. **Select the AutoPlay application from the Windows Start menu, click on the okay button, and then click on the installation icon on the hard drive.** All the files from the Photoshop Elements 10.0 trial are installed on your computer. There's an icon for the trial in the Start menu, and you can delete the trial if it's not working for you. For now, go to Step 7, but keep the trial program on hand. It may take a day or two for the trial to start up. The program is probably being added to the **\_Apps & Features\_ control panel**, which you need to access. (To find the **\_Apps & Features\_ control panel**, go to **Start | Control Panel | Programs**. If you don't see the program listed, search for the **\_Apps & Features\_ control panel**. See Figure 19-3.)
6. **Open the Apps & Features control panel.** It's under the Programs heading.
7. **Select the Adobe Photoshop Elements 10.0 folder.** To do so, go to the Adobe Photoshop Elements 10.0 folder in the Apps & Features list and press the Add button to add the program. You can have as many

### What's New In?

**Field of the Invention** The present invention relates to a gas turbine gas collector.

**Description of the Related Art** A compressor is used to pressurize air that is at the lowest pressure of a gas turbine, which in turn pressurizes air that is at the highest pressure of the gas turbine, to form compressed air. The compressed air is compressed to become a higher pressure and compressed to become a higher temperature, and this higher pressure and temperature compressed air is supplied into a combustion chamber (also referred to as the combustion chamber) in a gas turbine combustion section. A burner having an ignition section ignites the supplied compressed air. The gas produced by combustion in the burner is then supplied to a turbine where rotating blades of the turbine blades are driven by the gas. The rotating blades are coupled to a rotor shaft of the gas turbine and rotate. The rotational energy of the rotating blades is transmitted through a rotary shaft (rotor) to a generator, and this electric energy is taken out from the generator. The gas turbine's outlet temperature rises with increasing fuel consumption. Gas pressure and temperature rise and/or a rise in inlet pressure at the compressor of the gas turbine is controlled with a view to preventing damage to a turbine blade due to a rise in outlet temperature. The rise in outlet temperature is thus reduced to prevent damage to the turbine blade. A compressor may be provided with a gas collector, which is also referred to as an air cooler or heat exchanger, to cool the air that is delivered to the compressor. The gas collector is provided, for example, with a plurality of heat exchanging tubes through which compressed air is conducted in such a manner as to raise the temperature of the compressed air that is delivered from the compressor, and a plurality of fins through which the compressed air that has been raised in temperature flows. The heated compressed air that has been raised in temperature by the heat exchanging tubes is cooled by the fins and is discharged to the outside. The gas collector is often included in a heat exchanger that is mounted in the compressed air supply path, in particular in the compressed air supply path (casing) of a gas turbine, so that the gas collector is required to have good thermal conductivity. However, as this gas collector is exposed to a high temperature of the compressed air, and a high temperature heat source such as a gas turbine, the gas collector generally has a structure in which the cooling air is allowed to flow through the heat exchanging tubes and fins in a serpentine pattern in order
