I made this video for only one project. I like it and decided to share it with you. In it I show the process of creating my first robot. How it all began. And why I basically decided to make this kind of robot. As you can see, this is a very simple and straightforward scheme. It has a disadvantage but in principle if you are good with a soldering iron there is nothing to stop you from making a more complex and sophisticated circuit.

Second, it does not seem as though the hippocampus is playing an important role in cognitive decline. Imaging of normal aging indicates that with age, the hippocampus undergoes a process of degeneration leading to shrinkage and loss of neurons ([@B78]; [@B111]; [@B43]; [@B83]; [@B40]). It is currently unclear what impact, if any, this process has on hippocampal structure and connectivity. Even though evidence exists that the brain responds to non-familiar patterns, whether this response is the result of a loss of neurons is unknown ([@B36]). The current methodology was not appropriate to study volumetric changes within the hippocampus or the effect of these changes on changes in the functional network. An alternative approach that may have a better chance of detecting age-related structural and functional changes in the hippocampus would be a combination of a voxel-based morphometry (VBM) study and resting state fMRI. VBM would capture age-related volumetric changes within the hippocampus while resting state fMRI would help detect changes in the functional network. If changes were observed in both measures within the hippocampus, then the effects of the observed structural alterations on the functional network would be studied using graph theoretical analyses ([@B52]; [@B70]). The overall goal would be to elucidate if there are structural changes in the hippocampus that affect the structure of the functional network. However, there is a paucity of evidence for a direct relationship between structural alterations of the hippocampus and the functional network. Furthermore, alterations in the hippocampus are not due to the loss of neurons but rather a result of neuronal damage. This can c6a93da74d
